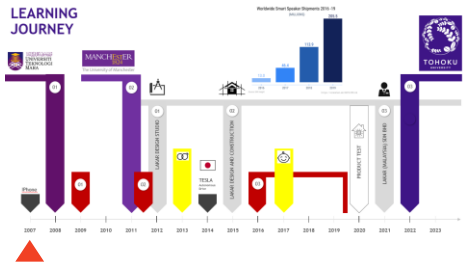
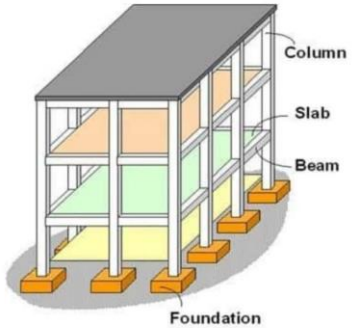
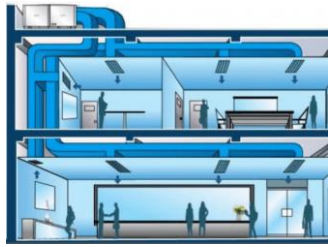
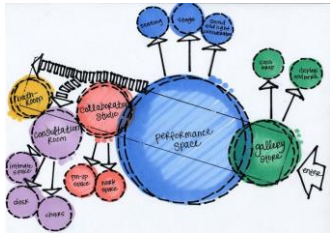
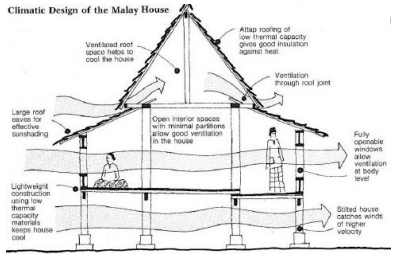
Architect in Training

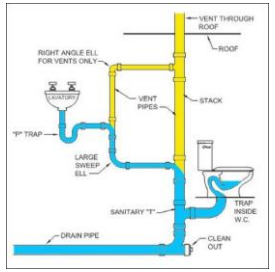












2007/DISSERTATION/ARTIFICIAL ARCHITECTURAL LIGHTING

Albert Einstein remarked, "The finest thing we can experience is the mysterious. It is the fundamental emotion, which stands at the cradle of true art and true science. He who does not know it and can no longer wonder, no longer feel amazement, is as good as dead, a snuffed-out candle."

Einstein's powerful words establish a common origin for both science and art—the exploration of the mysterious. The goal of lighting design is to help create amazement and wonder in the audience. Lighting is a powerful tool to accomplish that task.

True lighting design is not just about fulfilling lighting theory from a scientific or code a compliance perspective although that is equally important.

Light impacts architecture, perception, and usability. The interaction between the architecture and the lighting can be critical to the success of a project. The fundamental intent of the lighting process is to create a visual that captures the emotion and atmosphere of the story.

Good architecture should be informed by the elements that make up architectural lighting. From factors such as colour, brightnessm and contrast to light source and application.The dissertation intends to develop my understanding regarding elements that make up architectural lighting.

Barriers to Energy Efficiency of the Housing Stock,

Adam Bin M Raman

Abstract

Newly built houses only represent approximately 1% of the housing stock each year. It is estimated that by 2050 about two-thirds of the housing stock within the UK will have been built before 2005. Unless the energy efficiency of the current housing stock is addressed, energy consumption in the domestic sector will only rise above the current levels. This is a study of the factors that are preventing homeowners of the current stock of houses from upgrading their home to the current optimum energy efficiency standards. The study first looks at sources of carbon emissions in the domestic sector to allow an understanding of how energy is currently being used at home. Currently available technical measures to counter these problems are identified. A questionnaire and interview were conducted to identify why these solutions were not implemented. The questionnaire and interview were sent to a sample of homeowners of homes built in the late 19th century in Manchester which represents the majority of the existing housing stock built during the mass housing period in the UK. Homeowner have varying degree of awareness to the issue and varying degree of ability to address the issue.

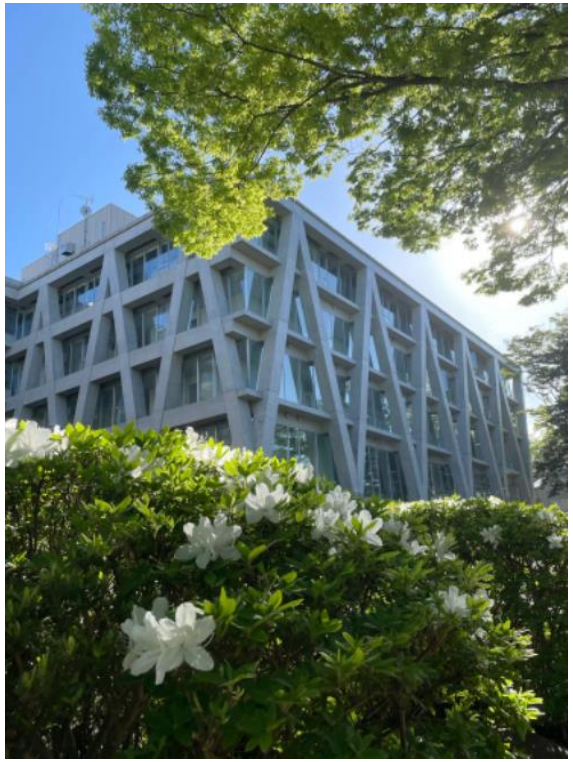
Prime Minister Datuk Seri Ismail Sabri Yaakob meets with Japanese Prime Minister Fumio Kishida in Tokyo, yesterday. This is the first meeting between the two leaders. – Bernama pic, May 28, 2022



TOKYO – Malaysia and Japan have agreed to upgrade bilateral relations to a more comprehensive level while continuing with the Look East Policy by establishing new areas of cooperation in matters such as energy, smart cities, the environment and climate change.
